Written by Ahmad Baharuddin Abdullah, determining career is a dilemma faced by most students especially those who will take exams such as SPM or STPM. To succeed in life, career determinations and selections need to be done as early as possible, this allows for sufficient preparation to ensure that goals are met. In fact, there are many books on the market that describe the best career and career choices. But rather fewer published books focus on specific areas. For this reason, this book is produced with more detail and emphasizes the academic needs and skills that students need to enter into a field and in this case engage in engineering. The engineering field is generally associated with engineer's career, but actually engineering graduates are also eligible to enter other fields such as marketing, business and so on.

The book also lists public and private higher education institutions offering engineering courses. In addition, general requirements and requirements are also provided as a guide to students, but these conditions usually change according to the conditions and needs of an institution. In practicing engineering practices, an engineer has an ethical code to follow, it is to ensure that the quality of care produced is best to avoid any undesirable events. The book also discusses the challenges that must be addressed before and during the course of an engineer. Hopefully, this book will provide information to students who are selecting career choices and further enhance the interest of students towards enlivening the number of engineers in line with the aspirations of becoming a developed nation through k-economy by 2020.

In today's context, career choice is more critical than the university you need to be. This is because after setting a career option, then you choose which university is best. However, you should also see and measure the extent of your academic ability. Generally there are courses at universities that require stringent academic requirements such as doctoral and engineering. But there are quite simple things like education and literature. Students need to know the courses they should follow while at the university so that their choices are in line with their academic interests and abilities. Therefore early planning is important. Perhaps nobody ever wanted to be an actor, a system analyst, a psychologist or a nuclear expert because such posts were not so exposed to general knowledge especially children. There are several factors that cause this to happen. Among them include work such as not involving the public, lacking in demand and being pursued by certain groups or races. It is even suitable for those who are interested in it and wish for a high commitment. Generally, one's career is more influenced by his academic interests and achievement than other factors. In Malaysia, you can enter the job market through several levels of academic training available in Malaysia.
